

# Package ‘MSGARCH’

August 8, 2016

**Type** Package

**Title** Markov-Switching GARCH models

**Version** 0.13

**Date** 2016-08-08

**Author** Keven Bluteau [aut, cre],  
David Ardia [aut]  
Denis-Alexandre Trottier [ctb]  
Kris Boudt [ctb]  
Brian Peterson [ctb]

**Maintainer** Keven Bluteau <keven.bluteau@unine.ch>

**Description** The MSGARCH package offer functionalities to fit (by Maximum Likelihood or Bayesian), simulate, and forecast various Markov-Switching GARCH processes.

**License** GPL (>= 2)

**Imports** Rcpp, adaptMCMC, DEoptim, nloptr, methods, stringr, ggplot2, reshape2, zoo

**LinkingTo** Rcpp, RcppArmadillo

**Depends** RcppArmadillo

**Suggests** knitr, rmarkdown, testthat

**VignetteBuilder** knitr

**RoxygenNote** 5.0.1

**NeedsCompilation** yes

## R topics documented:

MSGARCH-package

*The R package MSGARCH*

## Description

The R package MSGARCH aims to provide a comprehensive set of functionalities for Markov-switching GARCH processes, including fitting, filtering, forecasting, and simulating. Other functions related to Value-at-Risk, Expected-Shortfall, and conditional distributions are also available. The main functions of the package are coded in C++ with Rcpp (Eddelbuettel and Francois, 2011) and RcppArmadillo (Eddelbuettel and Sanderson, 2014). In the R package MSGARCH there is no equation for the mean as in the R package rugarch (Ghalanos, 2015). This means that we assume that before modeling, the user has filter the mean from their time series.

We provide a variety of single-regime GARCH process and regime-switching process as well as many conditional distributions. This allows for a rich modeling environment for Markov-switching GARCH models. Each single-regime process in a one-lag process (e.g., GARCH(1,1)). Allowing for only one-lag has proved to be sufficient in financial econometrics and it reduces models complexity which can become a problem during the optimization procedure.

The authors acknowledge Google for financial support via the Google Summer of Code 2016 project "MSGARCH"; see <https://summerofcode.withgoogle.com/projects/#6497774455488512>, the International Institute of Forecasting and Industrielle-Alliance.

---

AIC

*Compute Akaike information criterion (AIC).*

---

### Description

Compute Akaike information criterion (AIC).

### Usage

```
AIC(fit)
```

### Arguments

<code>fit</code>	Fit object of type MSGARCH_MLE_FIT created with <code>fit.mle</code> or MSGARCH_BAY_FIT created with <code>fit.bayes</code> .
------------------	---

### Details

If a matrix of MCMC posterior draws estimates is given, the AIC on the posterior mean is calculated.

### Value

AIC value.

### References

Akaike, H. (1974). A New Look at the Statistical Model Identification. *IEEE Transactions on Automatic Control*, 19, pp. 716-723.

### Examples

```
## Not run:
# load data
data("sp500ret")

# create model specification
spec = MSGARCH::create.spec()

# fit the model by MLE
fit = MSGARCH::fit.mle(spec = spec, y = sp500ret)

# compute AIC
AIC = MSGARCH::AIC(fit)

## End(Not run)
```

---

AMZN	<i>Log return of Amazon inc. closing Value</i>
------	--

---

**Description**

The Amazon inc. closing value log return from 1998-01-01 to 2015-12-31 from Yahoo Finance <https://ca.finance.yahoo.com/>.

**Usage**

```
data("AMZN")
```

**Format**

Matrix containing 4529 observations.

**Source**

Yahoo Finance <https://ca.finance.yahoo.com/>

---

BIC	<i>Compute Bayesian information criterion (BIC).</i>
-----	--

---

**Description**

Compute Bayesian information criterion (BIC).

**Usage**

```
BIC(fit)
```

**Arguments**

fit	Fit object of type MSGARCH_MLE_FIT created with <a href="#">fit.mle</a> or MSGARCH_BAY_FIT created with <a href="#">fit.bayes</a>
-----	---

**Details**

If a matrix of MCMC posterior draws estimates is given, the BIC on the posterior mean is calculated.

**Value**

BIC value.

**References**

Schwarz, G. (1978). Estimating the dimension of a model. *Annals of Statistics*, 6, pp. 461-464.

## Examples

```
## Not run:
# load data
data("sp500ret")

# create model specification
spec = MSGARCH::create.spec()

# fit the model by MLE
fit = MSGARCH::fit.mle(spec = spec, y = sp500ret)

# compute BIC
BIC = MSGARCH::BIC(fit)

## End(Not run)
```

---

cdf	<i>Cumulative function.</i>
-----	-----------------------------

---

## Description

Method returning the cumulative in-sample or of a vector of points at  $t = T + 1$ .

## Usage

```
cdf(object, x, theta, y, log = FALSE, is.its = FALSE)
```

## Arguments

object	Model specification of class MSGARCH_SPEC created with <a href="#">create.spec</a> or fit object of type MSGARCH_MLE_FIT created with <a href="#">fit.mle</a> or MSGARCH_BAY_FIT created with <a href="#">fit.bayes</a> .
x	Vector (of size N) of point at $t = T + 1$ to be evaluated (used when <code>is.its = FALSE</code> ).
theta	Vector (of size d) or matrix (of size M x d) of parameter estimates (not require when using a fit object).
y	Vector (of size T) of observations (not require when using a fit object).
log	Boolean indicating if the log cumulative is returned. (Default: <code>log = FALSE</code> )
is.its	Boolean indicating if the in-sample cdf is returned. (Default: <code>is.its = FALSE</code> )

## Details

If a matrix of parameter estimates is given, each parameter estimates is evaluated individually. If `is.its = FALSE`, the points `x` are evaluated as  $t = T + 1$  realization and the method uses the variance estimate at  $t = T + 1$ . If `is.its = TRUE`, `y` is evaluated using their respective variance estimate at each time `t`.

**Value**

A list of class MSGARCH\_CDF containing two components:

- cdf:
  - If is.its = FALSE: (Log-)Cumulative of the points  $x$  at  $t = T + 1$  (vector of size  $N$  or matrix of size  $M \times N$ ).
  - If is.its = TRUE: In-sample (Log-)Cumulative of  $y$  (vector of size  $T$  or matrix of size  $M \times T$ ).
- x:
  - If is.its = FALSE: Vector (of size  $N$ ) of point at  $t = T + 1$  evaluated.
  - If is.its = TRUE: Vector (of size  $T$ ) of observations.

The class MSGARCH\_CDF contains the plot method.

**Examples**

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(spec = spec, y = sp500)

# run pdf method in-sample
cdf.its = MSGARCH::cdf(object = fit, log = FALSE, is.its = TRUE)

plot(cdf.its)

# create mesh
x = seq(-3,3,0.01)

# run cdf method on mesh at T + 1
cdf = MSGARCH::cdf(object = fit, x = x, log = FALSE, is.its = FALSE)

plot(cdf)

## End(Not run)
```

---

create.spec

*Model specification*

---

**Description**

Function for creating a model specification before fitting and using the R package MSGARCH functionalities.

**Usage**

```
create.spec(model = c("sGARCH", "sGARCH"), distribution = c("norm", "norm"),
  do.skew = c(FALSE, FALSE), do.mix = FALSE, do.shape.ind = FALSE)
```

## Arguments

<code>model</code>	Vector (of size K) containing the variance model specifications. Valid models are "sGARCH", "eGARCH", "gjrGARCH", "tGARCH", and "GAS". (Default: <code>model = c("sGARCH", "sGARCH")</code> )
<code>distribution</code>	Vector (of size K) of conditional densities. Valid distribution are "norm", "std", and "ged". The vector must be of the same length as the models vector. (Default: <code>distribution = c("norm", "norm")</code> )
<code>do.skew</code>	Vector (of size K) of boolean indicating if the conditional density is skewed. The vector must be of the same length as the distributions vector. (Default: <code>do.skew = c(FALSE, FALSE)</code> )
<code>do.mix</code>	Boolean indicating if the specification is a mixture type. If the argument is TRUE, a Mixture of GARCH is created, while if the argument is FALSE, a Markov-Switching GARCH is created (see details). (Default: <code>do.mix = FALSE</code> )
<code>do.shape.ind</code>	Boolean indicating if the distribution are Regime-Independent. If the argument is TRUE, all distributions are the same and the distribution parameters does not dependent on the regime in which the distribution is attributed to. If the argument is TRUE, all distributions in the distribution argument and all skew argument must be the same. (Default: <code>do.shape.ind = FALSE</code> )

## Details

The Markov-Switching specification created is based on the Haas et al. (2004a) MSGARCH specification. It is a MSGARCH model that is separated in K single-regimes specifications which are updated in parallel. Under this specification, the conditional variance is a function of the past data and the current state. The Mixture of GARCH option is based on the Haas et al. (2004b). A Mixture of GARCH is a mixture of distribution where the variance process of each distribution is a single-regime process. Every single-regime specification is a one-lag process (e.g., GARCH(1,1)) since it has proved to be sufficient in financial econometrics and it reduces models complexity which can become a problem during the optimization procedure

## Value

A list of class MSGARCH\_SPEC containing variables related to the created specification.  
The list contains:

- `theta0` : Vector (of size d) of default parameters.
- `is.mix` : Boolean indicating if the specification is a mixture.
- `is.shape.ind` : Boolean indicating if the distribution parameters are regime-independent.
- `K` : Number of regimes.
- `sigma0` : Default variance-covariance matrix (of size K x K) used for the Bayesian estimation.
- `lower` : Vector (of size d) of lower parameters bound.
- `upper` : Vector (of size d) of upper parameters bound.
- `ineqlb` : Vector (of size d) of lower inequality bound.
- `inequb` : Vector (of size d) of upper inequality bound.
- `n.params` : Vector (of size K) of the total number of parameters by regime including distribution parameters.
- `n.params.vol` : Vector (of size K) of the total number of parameters by regime excluding distribution parameters.

- `do.init` : Boolean indicating the default `do.init` argument.
- `label` : Vector (of size `d`) of parameters label.
- `name` : Vector (of size `K`) of model specification name.
- `func` : List of `R` functions internally used.
- `rcpp.func` : List of `Rcpp` functions internally used.

The MSGARCH\_SPEC class possesses these methods:

- `sim` : Simulation method.
- `simahead` : Step ahead simulation method.
- `ht` : Conditional volatility in each regime.
- `kernel` : Kernel method.
- `unc.vol` : Unconditional volatility in each regime.
- `pred` : Predictive method.
- `pit` : Probability Integral Transform.
- `risk` : Value-at-Risk And Expected-Shortfall methods.
- `pdf` : Probability density function.
- `cdf` : Cumulative function.
- `Pstate` : State probabilities filtering method.
- `fit.mle` : Maximum Likelihood estimation.
- `fit.bayes` : Bayesian estimation.
- `print` and `summary` : Summary of the created specification.

## Examples

```
# create model specification
spec = MSGARCH::create.spec(model = c("sGARCH", "gjrGARCH"), distribution = c("norm", "std"),
                             do.skew = c(TRUE, FALSE), do.mix = FALSE, do.shape.ind = FALSE)
print(spec)
```

---

DIC

---

*Compute Deviance Information Criterion (DIC).*

---

**Description**

Compute Deviance Information Criterion (DIC).

**Usage**

DIC(fit)

**Arguments**

fit                      Fit object of type MSGARCH\_BAY\_FIT created with [fit.bayes](#).

**Value**

A list containing six variables:

- DIC : Deviance Information Criterion.
- IC : Bayesian Predictive Information Criterion.
- pD : Effective number of parameters ( $pD = \bar{D} - \hat{D}$ )
- pV : Effective number of parameters ( $pV = \text{var}(\hat{D})/2$ )
- D.bar: Expected value of the deviance over the posterior
- D.hat: Deviance at the mean posterior estimate

**References**

**Examples**

```
## Not run:
# load data
data("sp500ret")

# create model specification
spec = MSGARCH::create.spec()

# fit the model by Bayesian estimation
set.seed(123)
fit = MSGARCH::fit.bayes(spec = spec, y = sp500ret)

# compute DIC
DIC = MSGARCH::DIC(fit)

## End(Not run)
```

---

fit.bayes	<i>Bayesian estimation.</i>
-----------	-----------------------------

---

## Description

Method that performs Bayesian estimation of a MSGARCH\_SPEC object on a set of observations.

## Usage

```
fit.bayes(spec, y, ctr = list())
```

## Arguments

spec	Model specification of class MSGARCH_SPEC created with <a href="#">create.spec</a> .
y	Vector (of size T) of observations.
ctr	A list of control parameters. The control parameters have three components: <ul style="list-style-type: none"> <li>• N.burn (integer &gt;= 0): Number of discarded draws. (Default: N.burn = 5000)</li> <li>• N.mcmc (integer &gt; 0) : Number of draws. (Default: N.mcmc = 10000)</li> <li>• N.thin (integer &gt; 0) : Thinning factor (every N.thin draws are kept). (Default: N.thin = 10)</li> <li>• theta0 : Starting value for the chain (if empty the specification default value are used).</li> <li>• enhance.theta0 : Boolean indicating if the default parameters value are enhance using y variance. (Default: enhance.theta0 = FALSE)</li> </ul>

## Details

The total number of draws is equal to N.mcmc / N.thin. The Bayesian estimation uses the R package adaptMCMC (Andreas, 2012) which implements the adaptive sampler of Vihola (2012). The argument enhance.theta0 uses the volatilities of rolling windows of y and adjust the default parameter of the specification so that the unconditional volatility of each regime is set to different quantiles of the volatilities of the rolling windows of y.

## Value

A list of class MSGARCH\_BAY\_FIT containing four components:

- theta : The MCMC chain (matrix from the R package coda (Plummer et al., 2006) of size N.mcmc / N.thin).
- accept : Acceptation rate of the sampler.
- y : Vector (of size T) of observations.
- spec : Model specification of class MSGARCH\_SPEC created with [create.spec](#).

The MSGARCH\_BAY\_FIT contains these methods:

- [AIC](#) : Compute Akaike information criterion (AIC).
- [BIC](#) : Compute Bayesian information criterion (BIC).
- [DIC](#) : Compute Deviance Information Criterion (DIC).

- `ht` : Conditional volatility in each regime.
- `kernel` : Kernel method.
- `unc.vol` : Unconditional volatility in each regime.
- `pred` : Predictive method.
- `pit` : Probability Integral Transform.
- `risk` : Value-at-Risk And Expected-Shortfall methods.
- `simahead` : Step ahead simulation method.
- `pdf` : Probability density function.
- `cdf` : Cumulative function.
- `Pstate` : State probabilities filtering method.

## Examples

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with Bayesian estimation
set.seed(123)
fit = MSGARCH::fit.bayes(spec = spec, y = sp500,
                        ctr = list(N.burn = 100, N.mcmc = 1000, N.thin = 1))

## End(Not run)
```

---

fit.mle

*ML estimation.*

---

## Description

Method that performs Maximum Likelihood estimation of a MSGARCH\_SPEC object on a set of observations.

## Usage

```
fit.mle(spec, y, ctr = list())
```

## Arguments

<code>spec</code>	Model specification created with <a href="#">create.spec</a> .
<code>y</code>	Vector (of size T) of observations.
<code>ctr</code>	List of control parameters. The control parameters have two components to it: <ul style="list-style-type: none"> <li>• <code>do.init</code> : Boolean indicating if there is a pre-optimization with the R package DEoptim (Ardia et al., 2011). (Default: <code>do.init = TRUE</code>)</li> <li>• <code>NP</code> : Number of parameter vectors in the population in DEoptim optimization. (Default: <code>NP = 200</code>)</li> <li>• <code>itermax</code> : Maximum iteration (population generation) allowed in DEoptim optimization. (Default: <code>maxit = 200</code>)</li> <li>• <code>enhance.theta0</code> : Boolean indicating if the default parameters value are enhance using y variance. (Default: <code>enhance.theta0 = TRUE</code>)</li> </ul>

## Details

The Maximum likelihood estimation uses the R package `nloptr` (Johnson, 2014) for main optimizer while it uses the R package `DEoptim` when `do.init = TRUE` as an initialization for `nloptr`. The argument `enhance.theta0` uses the volatilities of rolling windows of `y` and adjust the default parameter of the specification so that the unconditional volatility of each regime is set to different quantiles of the volatilities of the rolling windows of `y`.

## Value

A list of class `MSGARCH_MLE_FIT` containing five components:

- `theta` : Optimal parameters (vector of size d).
- `ll_likelihood` : log-likelihood of `y` given the optimal parameters.
- `spec` : Model specification of class `MSGARCH_SPEC` created with [create.spec](#).
- `is.init` : Indicating if estimation was made with `do.init` option.
- `y` : Vector (of size T) of observations.

The `MSGARCH_MLE_FIT` contains these methods:

- [AIC](#) : Compute Akaike information criterion (AIC).
- [BIC](#) : Compute Bayesian information criterion (BIC).
- [ht](#) : Conditional volatility in each regime.
- [kernel](#) : Kernel method.
- [unc.vol](#) : Unconditional volatility in each regime.
- [pred](#) : Predictive method.
- [pit](#) : Probability Integral Transform.
- [risk](#) : Value-at-Risk And Expected-Shortfall methods.
- [simahead](#) : Step ahead simulation method.
- [pdf](#) : Probability density function.
- [cdf](#) : Cumulative function.
- [Pstate](#) : State probabilities filtering method.

## Examples

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(spec = spec, y = sp500,
                      ctr = list(do.init = TRUE, NP = 500, itermax = 500))

## End(Not run)
```

---

ht

*Conditional volatility in each regime.*

---

## Description

Method returning the conditional volatility in each regime.

## Usage

```
ht(object, theta, y)
```

## Arguments

- |        |   |
|--------|---|
| object | Model specification of class MSGARCH_SPEC created with <a href="#">create.spec</a> or fit object of type MSGARCH_MLE_FIT created with <a href="#">fit.mle</a> or MSGARCH_BAY_FIT created with <a href="#">fit.bayes</a> . |
| theta  | Vector (of size d) or matrix (of size M x d) of parameter estimates (not require when using a fit object).  |
| y      | Vector (of size T) of observations (not require when using a fit object).   |

## Details

If a matrix of parameter estimates is given, each parameter estimates is evaluated individually.

**Value**

Conditional volatility time serie (array of size  $(T + 1) \times M \times K$ ) in each regime.

**Examples**

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(spec = spec, y = sp500)

# Compute the conditional volatility
ht = MSGARCH::ht(object = fit)

plot(ht)

## End(Not run)
```

---

kernel

*Kernel function.*

---

**Description**

Method returning the kernel value of a vector of observations given a model specification.

**Usage**

```
kernel(object, theta, y, log = TRUE)
```

**Arguments**

object	Model specification of class MSGARCH_SPEC created with <a href="#">create.spec</a> or fit object of type MSGARCH_MLE_FIT created with <a href="#">fit.mle</a> or MSGARCH_BAY_FIT created with <a href="#">fit.bayes</a> .
theta	Vector (of size d) or matrix (of size $M \times d$ ) of parameter estimates (not require when using a fit object).
y	Vector (of size T) of observations (not require when using a fit object).
log	Boolean indicating if the log kernel is returned. (Default: log = TRUE)

**Details**

If a matrix of parameter estimates is given, each parameter estimates is evaluated individually. The kernel is a combination of the prior and the likelihood function. The kernel is equal to  $\text{prior}(\theta) + L(y|\theta)$  where  $L$  is the likelihood of  $y$  given the parameter  $\theta$ . When doing optimization, the goal is to minimize the negative log-kernel.

- Details on the prior

The prior is different for each specification. It ensures that the  $\theta$  makes the conditional variance process stationary, positive, and that it respect that the sums of the probabilities in the case of a multiple-regime models are all equal to 1. If any of these three conditions is not respected the prior return  $-1e10$ , meaning that the optimizer or sampler will know that  $\theta$  is not a good candidate.

## Value

(Log-)Kernel value (scalar or vector of size M) of the vector of observations.

## References

Hamilton, J. D. (1989) A New Approach to the Economic Analysis of Nonstationary Time Series and the Business Cycle. *Econometrica*, 57, pp.357-38

## Examples

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(spec = spec, y = sp500)

# compute the kernel
kernel = MSGARCH::kernel(fit, log = TRUE)

## End(Not run)
```

---

pdf

---

*Probability density function.*

---

## Description

Method returning the probability density in-sample or of a vector of points at  $t = T + 1$ .

## Usage

```
pdf(object, x, theta, y, log = FALSE, is.its = FALSE)
```

## Arguments

object	Model specification of class MSGARCH_SPEC created with <code>create.spec</code> or fit object of type MSGARCH_MLE_FIT created with <code>fit.mle</code> or MSGARCH_BAY_FIT created with <code>fit.bayes</code> .
x	Vector (of size N) of point at $t = T + 1$ to be evaluated (used when <code>is.its = FALSE</code> ).
theta	Vector (of size d) or matrix (of size M x d) of parameter estimates (not require when using a fit object).

<code>y</code>	Vector (of size $T$ ) of observations (not require when using a fit object).
<code>log</code>	Boolean indicating if the log-density is returned. (Default: <code>log = FALSE</code> )
<code>is.its</code>	Boolean indicating if the in-sample pdf is returned. (Default: <code>is.its = FALSE</code> )

### Details

If a matrix of parameter estimates is given, each parameter estimates is evaluated individually. If `is.its = FALSE`, the points  $x$  are evaluated as  $t = T + 1$  realization and the method uses the variance estimate at  $t = T + 1$ . If `is.its = TRUE`,  $y$  is evaluated using their respective variance estimate at each time  $t$ .

### Value

A list of class `MSGARCH_PDF` containing two components:

- `pdf`:  
If `is.its = FALSE`: (Log-)Probability density of the points  $x$  at  $t = T + 1$  (vector of size  $N$  or matrix of size  $M \times N$ )  
If `is.its = TRUE`: In-sample (Log-)Probability density of  $y$  (vector of size  $T$  or matrix of size  $M \times T$ ).
- `x`:  
If `is.its = FALSE`: Vector (of size  $N$ ) of point at  $t = T + 1$  evaluated.  
If `is.its = TRUE`: Vector (of size  $T$ ) of observations.

The class `MSGARCH_PDF` contains the `plot` method.

### Examples

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(spec = spec, y = sp500)

# run pdf method in-sample
pdf.its = MSGARCH::pdf(object = fit, log = FALSE, is.its = TRUE)

plot(pdf.its)

# create mesh
x = seq(-3,3,0.01)

# run pdf method on mesh at  $T + 1$ 
pdf = MSGARCH::pdf(object = fit, x = x, log = FALSE, is.its = FALSE)

plot(pdf)

## End(Not run)
```

pit

*Probability Integral Transform.***Description**

Method returning the predictive Probability integral transform (PIT) in-sample or of a vector of points at  $t = T + 1$ .

**Usage**

```
pit(object, x, theta, y, do.norm = FALSE, is.its = FALSE)
```

**Arguments**

object	Model specification of class MSGARCH_SPEC created with <a href="#">create.spec</a> or fit object of type MSGARCH_MLE_FIT created with <a href="#">fit.mle</a> or MSGARCH_BAY_FIT created with <a href="#">fit.bayes</a> .
x	Vector (of size N) of point at $t = T + 1$ to be evaluated (used when <code>is.its = FALSE</code> ).
theta	Vector (of size d) or matrix (of size M x d) of parameter estimates (not require when using a fit object).
y	Vector (of size T) of observations (not require when using a fit object).
do.norm	Boolean indicating if the PIT value are transforms into standard Normal variate. (Default: <code>do.norm = FALSE</code> ).
is.its	Boolean indicating if the in-sample pit is returned. (Default: <code>is.its = FALSE</code> )

**Details**

If a matrix of MCMC posterior draws estimates is given, the Bayesian Probability integral transform is calculated. If `is.its = FALSE`, the points `x` are evaluated as  $t = T + 1$  realization and the method uses the variance estimate at  $t = T + 1$ . If `is.its = TRUE`, `y` is evaluated using their respective variance estimate at each time  $t$ . The `do.norm` argument transforms the PIT value into Normal variate so that normality test can be done.

**Value**

A list of class MSGARCH\_PIT containing two components:

- `pit`:  
If `is.its = FALSE`: Probability integral transform of the points `x` at  $t = T + 1$  or Normal variate derived from the Probability integral transform of `x` (vector of size N).  
If `is.its = TRUE`: In-sample Probability integral transform or Normal variate derived from the Probability integral transform of `y` (vector of size T or matrix of size M x T).
- `x`:  
If `is.its = FALSE`: Vector (of size N) of at point  $t = T + 1$  evaluated.  
If `is.its = TRUE`: Vector (of size T) of observations.

The class MSGARCH\_PIT contains the `plot` method.

## Examples

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(spec = spec, y = sp500)

# run pit method in-sample
pit.its = MSGARCH::pit(object = fit, do.norm = FALSE, is.its = TRUE)

plot(pit.its)

# generate random draws at T + 1 from model
set.seed(123)
sim.ahead = MSGARCH::simahead(object = fit, n = 1, m = 10000)

x = sim.ahead$draws

# run pit method on random draws at T + 1 from model
pit = MSGARCH::pit(object = fit, x = x, do.norm = FALSE)

plot(pit)

## End(Not run)
```

---

pred

*Predictive function.*

---

## Description

Method returning the predictive probability density in-sample or of a vector of points at  $t = T + 1$ .

## Usage

```
pred(object, x, theta, y, log = TRUE, is.its = FALSE)
```

## Arguments

object	Model specification of class MSGARCH_SPEC created with <a href="#">create.spec</a> or fit object of type MSGARCH_MLE_FIT created with <a href="#">fit.mle</a> or MSGARCH_BAY_FIT created with <a href="#">fit.bayes</a> .
x	Vector (of size N) of point at $t = T + 1$ to be evaluated (used when <code>is.its = FALSE</code> ).
theta	Vector (of size d) or matrix (of size M x d) of parameter estimates (not require when using a fit object).
y	Vector (of size T) of observations (not require when using a fit object).
log	Boolean indicating if the log-density is returned. (Default: <code>log = TRUE</code> )
is.its	Boolean indicating if the in-sample predictive is returned. (Default: <code>is.its = FALSE</code> )

## Details

If a matrix of MCMC posterior draws estimates is given, the Bayesian Probability integral transform is calculated. If `is.its = FALSE`, the points `x` are evaluated as  $t = T + 1$  realization and the method uses the variance estimate at  $t = T + 1$ . If `is.its = TRUE`, `y` is evaluated using their respective variance estimate at each time `t`.

## Value

A list of class `MSGARCH_PRED` containing two components:

- `pred`:  
If `is.its = FALSE`: (Log-)Predictive of the points `x` at  $t = T + 1$  (vector of size `N`).  
If `is.its = TRUE`: In-sample Predictive of `y` (vector of size `T` or matrix of size `M x T`).
- `x`:  
If `is.its = FALSE`: Vector (of size `N`) of point at  $t = T + 1$  evaluated.  
If `is.its = TRUE`: Vector (of size `T`) of observations.

The class `MSGARCH_PRED` contains the `plot` method.

## Examples

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(object = spec, y = sp500)

# run pred method in-sample
pred.its = MSGARCH::pred(object = fit, log = TRUE, is.its = TRUE)

plot(pred.its)

# create mesh
x = seq(-3,3,0.01)

# run pred method on mesh at T + 1
pred = MSGARCH::pred(object = fit, x = x, log = TRUE, is.its = FALSE)

plot(pred)

## End(Not run)
```

---

Pstate

*Filtered state probabilities.*

---

## Description

Method returning the filtered state probabilities.

**Usage**

```
Pstate(object, theta, y)
```

**Arguments**

object	Model specification of class MSGARCH_SPEC created with <code>create.spec</code> or fit object of type MSGARCH_MLE_FIT created with <code>fit.mle</code> or MSGARCH_BAY_FIT created with <code>fit.bayes</code> .
theta	Vector (of size d) or matrix (of size M x d) of parameter estimates (not require when using a fit object).
y	Vector (of size T) of observations (not require when using a fit object).

**Details**

If a matrix of parameter estimates is given, each parameter estimates is evaluated individually.

**Value**

Filtered state probabilities of class MSGARCH\_PSTATE (array of size  $(T + 1) \times M \times K$ ). The class MSGARCH\_PSTATE contains the plot method.

**Examples**

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(spec = spec, y = sp500)

# compute the filtered state probabilities
Pstate = MSGARCH::Pstate(object = fit)

plot(Pstate)

## End(Not run)
```

---

risk

---

*Value-at-Risk And Expected-shortfall.*

---

**Description**

Method returning the Value-at-Risk and Expected-shortfall in-sample or at  $t = T + 1$  based on the predictive density.

**Usage**

```
risk(object, theta, y, level = c(0.95, 0.99), ES = TRUE, is.its = FALSE)
```

## Arguments

object	Model specification of class MSGARCH_SPEC created with <code>create.spec</code> or fit object of type MSGARCH_MLE_FIT created with <code>fit.mle</code> or MSGARCH_BAY_FIT created with <code>fit.bayes</code> .
theta	Vector (of size d) or matrix (of size M x d) of parameter estimates (not require when using a fit object).
y	Vector (of size T) of observations (not require when using a fit object).
level	Vector (of size R) of Value-at-risk and Expected-shortfall levels. (Default: level = c(0.95, 0.99))
ES	Boolean indicating if Expected-shortfall is also calculated. (Default: ES = TRUE)
is.its	Boolean indicating if the in-sample risk estimator are returned. (Default: is.its = FALSE)

## Details

If a matrix of MCMC posterior draws estimates is given, the Bayesian Value-at-Risk and Expected-shortfall are calculated. If `is.its = FALSE`, the risk estimator at  $t = T + 1$ , the method uses the variance estimated at  $t = T + 1$ . If `is.its = TRUE`, The in-sample risk estimator are calculated.

## Value

A list containing of class MSGARCH\_RISK containing two or three components:

- VaR :  
If `is.its = FALSE`: Value-at-Risk at  $t = T + 1$  at the choosen levels (vector of size R).  
If `is.its = TRUE`: In-sample Value-at-Risk at the choosen levels (Matrix of size T x R).
- ES :  
If `is.its = FALSE`: Expected-shortfall at  $t = T + 1$  at the choosen levels (vector of size R).  
If `is.its = TRUE`: In-sample Expected-shortfall at the choosen levels (Matrix of size T x R).
- y : Vector (of size T) of observations.

The MSGARCH\_RISK contains the plot method. The Bayesian risk estimator can take long time to calculate depending on the size of the chain.

## Examples

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(spec = spec, y = sp500)

# compute the Value-at-Risk and Expected-shortfall
# Risk estimation in-sample
risk.its = MSGARCH::risk(object = fit, level = c(0.95, 0.99), ES = TRUE, is.its = TRUE)

plot(risk.its)

# Risk estimation at T + 1
```

```
risk = MSGARCH::risk(object = fit, level = c(0.95,0.99), ES = TRUE, is.its = FALSE)

## End(Not run)
```

---

sim	<i>Process simulation method.</i>
-----	-----------------------------------

---

## Description

Method returning a MSGARCH specification process.

## Usage

```
sim(spec, n, m, theta, burnin = 500)
```

## Arguments

spec	Model specification of class MSGARCH_SPEC created with <a href="#">create.spec</a> .
n	Simulation length.
m	Number of simulation.
theta	Vector (of size d) or matrix (of size M x d) of parameter estimates.
burnin	(integer >= 0) Burnin period discarded (first simulation draws). (Default: burnin = 500)

## Details

If a matrix of parameter estimates is given, each parameter estimates is evaluated individually and `m = nrow(theta)`.

## Value

A list of class MSGARCH\_SIM containing two components.

- `draws`: Matrix (of size M x n) of simulated draws.
- `state`: Matrix (of size M x n) of simulated states.

The MSGARCH\_SIM class contains the `plot` method.

## Examples

```
# create model specification
spec = MSGARCH::create.spec()

# generate process
set.seed(123)
sim = MSGARCH::sim(spec = spec, n = 1000, m = 1, theta = spec$theta0, burnin = 500)

plot(sim)
```

---

simahead	<i>Step ahead simulation method.</i>
----------	--------------------------------------

---

## Description

Method returning step ahead simulation up to time  $h$ .

## Usage

```
simahead(object, n, m, theta, y)
```

## Arguments

object	Model specification of class MSGARCH_SPEC created with <code>create.spec</code> or fit object of type MSGARCH_MLE_FIT created with <code>fit.mle</code> or MSGARCH_BAY_FIT created with <code>fit.bayes</code> .
n	Number of step ahead time step. (Default: $n = 1$ )
m	Number of simulation. (Default: $m = 1$ )
theta	Vector (of size $d$ ) or matrix (of size $M \times d$ ) of parameter estimates (not require when using a fit object).
y	Vector (of size $T$ ) of observations (not require when using a fit object).

## Details

If a matrix of parameter estimates is given, each parameter estimates is evaluated individually and  $m = \text{nrow}(\text{theta})$ . Be aware that the method is currently very slow and not optimal. The MSGARCH\_SIM class contains the `plot` method.

## Value

A list of class MSGARCH\_SIM containing two components:

- `draws`: Matrix (of size  $n \times h$  or  $M \times h$ ) of step ahead simulated draws.
- `state`: Matrix (of size  $n \times h$  or  $M \times h$ ) of step ahead simulated states.

## Examples

```
## Not run:
# load data
data("sp500")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(spec = spec, y = sp500)

# generate random draws
set.seed(123)
simahead = MSGARCH::simahead(object = fit, n = 30, m = 1000)
```

```
plot(simahead)

## End(Not run)
```

---

sp500

*Log return of the S&P 500 index closing Value*

---

### Description

The S&P 500 index closing value log return from 1998-01-01 to 2015-12-31 from Yahoo Finance <https://ca.finance.yahoo.com/>.

### Usage

```
data("sp500")
```

### Format

Matrix containing 4529 observations.

### Source

Yahoo Finance <https://ca.finance.yahoo.com/>

---

transmat

*Transition Matrix.*

---

### Description

Method returning the transition matrix.

### Usage

```
transmat(object, theta)
```

### Arguments

object	Model specification of class MSGARCH_SPEC created with <a href="#">create.spec</a> or fit object of type MSGARCH_MLE_FIT created with <a href="#">fit.mle</a> .
theta	Vector (of size d) of parameter estimates (not require when using a fit object).

### Value

A matrix (of size K x K) in the case of a Markov-Switching model or a vector (of size K) in the case of a Mixture model.

**Examples**

```
## Not run:
# load data
data("sp500ret")

# create model specification
spec = MSGARCH::create.spec()

# fit the model on the data with ML estimation using DEoptim initialization
set.seed(123)
fit = MSGARCH::fit.mle(spec = spec, y = sp500ret)

# run pdf method in-sample
transmat.mle = MSGARCH::transmat(fit)

print(transmat.mle)

## End(Not run)
```

unc.vol

*Unconditional volatility of each regime.***Description**

Method returning the unconditional volatility of the process in each state.

**Usage**

```
unc.vol(object, theta)
```

**Arguments**

object	Model specification of class MSGARCH_SPEC created with <a href="#">create.spec</a> or fit object of type MSGARCH_MLE_FIT created with <a href="#">fit.mle</a> or MSGARCH_BAY_FIT created with <a href="#">fit.bayes</a> .
theta	Vector (of size d) or matrix (of size M x d) of parameter estimates (not require when using a fit object).

**Details**

If a matrix of parameter estimates is given, each parameter estimates is evaluated individually.

**Value**

Unconditional volatility (vector of size K or matrix of size M x K) of each regime.

**Examples**

```
# create model specification
spec = MSGARCH::create.spec()

# compute the unconditional volatility in each regime
unc.vol = MSGARCH::unc.vol(object = spec, theta = spec$theta0)
```
